

**ABSTRACT**

The invention relates to a motor vehicle seat, in particular a rear row of seats of a motor vehicle, that is displaceable between a seat position and a functional position, having a seat part (3) adjustable relative to a seat frame (2), a back rest (4) foldable relative to the seat part, a front  
5 handle (11) for unlocking a seat longitudinal locking unit (8) of the seat part (3), a handle (24) operated from a rear position of the back rest (4), by means of which the seat longitudinal locking (8) of the seat part (3) can be unlatched; it is possible to check, whether the seat part (3) is in a rear position; if the seat part (3) is in the rear position, a rest blocking unit of the back rest (4) can be released. According to the invention, a simple displacement of the motor vehicle seat,  
10 in particular also from the rear side, is achieved.
